

Resetting CMOS when updating to Blue Bios

1. Drop your books as a safety precaution to not lose the accounting.
2. Turn board off – install blue bios chip – Make sure notch points towards batteries or you will blow chip up.
3. Change JP9 to 2-3 pins for 30 seconds

4. Change JP9 back to 1-2 pins

5. Turn board back on – it will boot to blue screen which is the correct color – cursor will be in the upper left corner for a couple seconds before it moves to bottom lower left corner. If it doesn't move to lower corner – repeat steps
6. If you still have issues please contact American Amusements ext 20
